

1, Explain behaviour of hub device

It is Layer-1 device, this Broadcast device. It is use to connect multiple network devices. It is single basic working. It is designed Bus topology, one of colleagues devices. Local Area Network [LAN]. It take data from one port and broadcasts it to all other ports. half duplex device single way communication.

2, Explain behaviour of switch device - data link layer - Address learning

Switch is Layer-2 device, this Broadcast device. It is use to connect multiple network devices. It contains mac tables. will act as broadcast + unicast. Switch stored data with in 5 minits temporary holding. source mac, destination mac sent to mac table and port number. also switch broadcast all connected devices, and check destination mac in table or not. If when it is find the mac again stored mac table. after sent unicast. It is one of the Intelligent devices.

x disadvantages: single Broadcast domain.

3, Explain behaviour of router device

- * It is use to beales broadcast domain - Network layer - It is layer-3 device.
- * It is a unicast device
- * It contains routing tables
- * Its routing table contains list of route, It is different network.
- * It is router is a device that connects two or more packet switched network (or) subnetworks
